

Three business insights based on the dashboard

1. Revenue and order volume are heavily concentrated in São Paulo.

São Paulo (SP) generates roughly 4x more orders than the next-largest state (RJ), making it the dominant driver of the platform's R\$15.74M total revenue. This concentration suggests fulfillment and inventory resources should be prioritized in and around SP to protect service levels where most demand originates.

Recommendation: Prioritize fulfillment capacity, warehousing, and seller onboarding in and around SP to protect service levels where most demand originates, while running targeted growth campaigns in RJ and MG to reduce overdependence on a single state.

2. Credit card is the overwhelmingly preferred payment method.

Credit card accounts for 78.88% of payment value (R\$12.42M), with boleto a distant second at 18.22% and voucher/debit card together under 2%. This signals an opportunity to strengthen credit card-based promotions and checkout experience, since it's the primary revenue channel by a wide margin.

Recommendation: Strengthen credit card checkout experience (installment options, fraud checks, loading speed) since it drives the bulk of revenue, and investigate why boleto/voucher usage is low. It could be worth testing incentives to shift more boleto users toward faster digital payment methods, improving cash flow predictability.

3. Customer satisfaction remains high despite slower delivery speeds.

The average review score is 4.07 out of 5, and the distribution skews strongly toward 5-star ratings — yet the majority of orders fall into the "Slow" delivery-speed category rather than "Fast" or "Standard." This suggests delivery speed isn't currently hurting satisfaction much, but improving it could be a meaningful lever to push average scores even higher and shrink the smaller cluster of 1-3 star reviews.

Recommendation: Investigate the smaller cluster of 1-3 star reviews specifically for a delivery-speed correlation. Even modest improvements to logistics turnaround could push average scores higher and convert detractors into promoters, since satisfaction appears resilient but not maximized.
